

Data-Intensive Systems

Bachelor project proposals 2023

Ira Assent, Cigdem Aslay, Panagiotis Karras, Davide Mottin

Our research group

Our interests

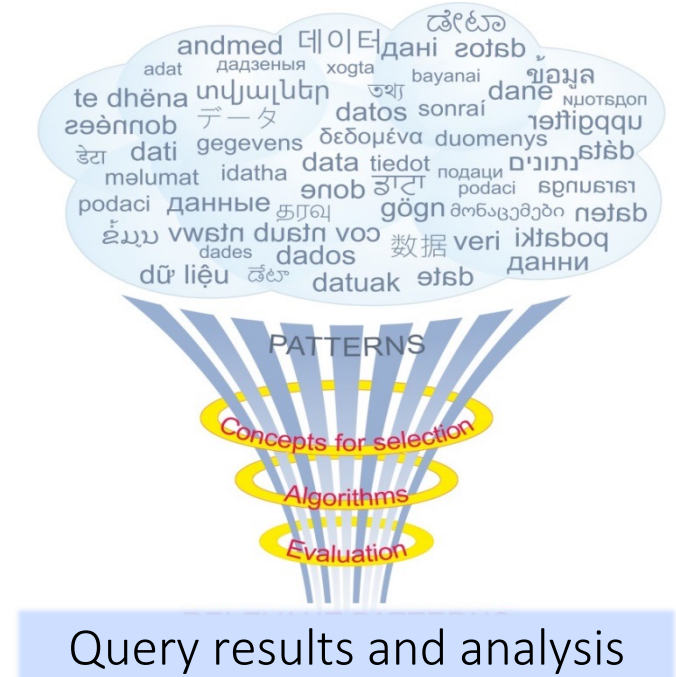

- Data management, data analysis, machine learning
- Efficiency and scalability
- Models and algorithms

Our methods

- Formalize real world problems
- Devise concepts and algorithmic solutions
- Evaluate empirically

Our tools and results

- Theoretical analysis and prototype implementations

Projects in a Nutshells

BESo: Beyond Entity
Summarization (4)

SaSSo: Scalable (Spectral)
Subgraph Localization (5)

Densely Connected
Subgraphs in Dual Graphs
(DCS-Dual) (9)

Elastic Graph Indexing (10)

Graph intelligence 

Evolutionary games and spatial
upstream reciprocity (1)

Structural social balance under
controversy (2)

Similarity Search with Dynamic
Time Warping (3)

Using 3D-Shape Descriptors
for Clustering of Molecular
Dynamics Data (8)

Interaction Models 

Studying the fairness of ML
models (6)

Automatically labeling data
for classifying rhetorical
appeals (7)

ML for detecting issues

Graph intelligence

BESo: Beyond Entity Summarization

Densely Connected Subgraphs in Dual Graphs (DCS-Dual)

SaSSo: Scalable (Spectral) Subgraph Localization

Elastic graph indexing

How can we describe an entity (e.g., a patient) compactly?

How do we find communities in a very special graph?

How do we efficiently find a graph inside another graph?

Can we use the "shape" of the graph to search fast?

Interaction models

Using 3D-Shape Descriptors
for Clustering of Molecular
Dynamics Data

Can we find similar proteins by
using their 3D-shape?

Evolutionary games and
spatial upstream reciprocity

Why do we spend time, effort,
and resources in cooperating
with others?

Structural social balance
under controversy

Can there be stability if
controversial arguments are
discussed?

Similarity Search with
Dynamic Time Warping

How can we efficiently search time
series under complex distance
models?

Detecting issues

Studying the fairness of
ML models

Is a ML algorithm fair? Is the
underlying data fair? What
are good models for
fairness?

Automatically labeling data for
classifying rhetorical appeals

Can we detect rhetorical
appeals in texts e.g. to
detect misinformation?
